

CSE 2102 PROJECT

1. INITIAL SET UP

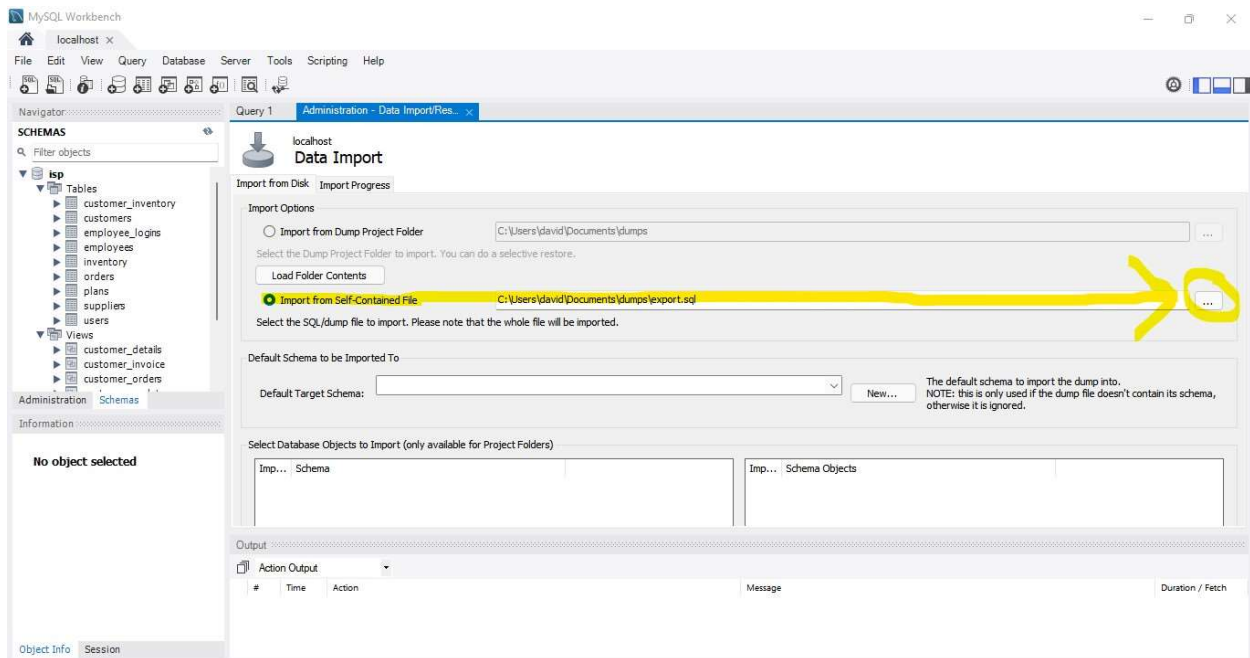

- DATABASE IMPORTING

Importing the database export file (located in the "DATABASE EXPORT" folder) is the first thing that needs to be done in order to get the application up and running.

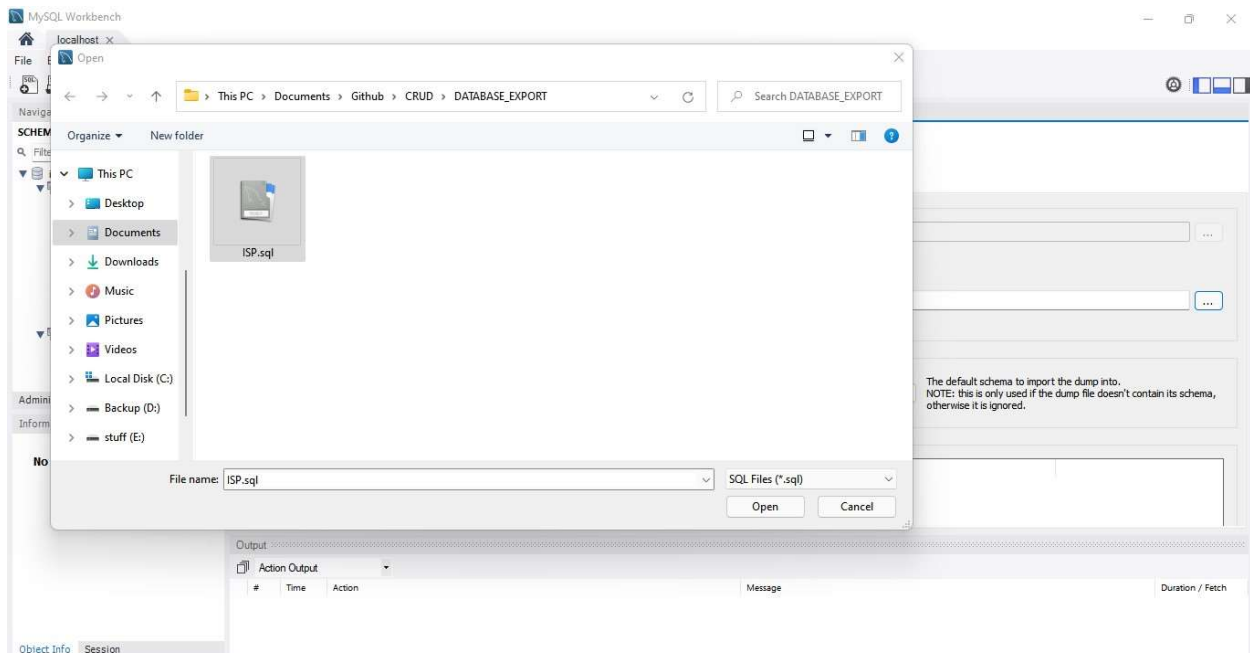

This is done by opening your "MYSQL WORKBENCH", logging in and going to the "SERVER TAB" (menu at the top of the screen)

The next step is selecting the "IMPORT FROM SELF CONTAINED FILE" option and then clicking the "..." button to select the database file.

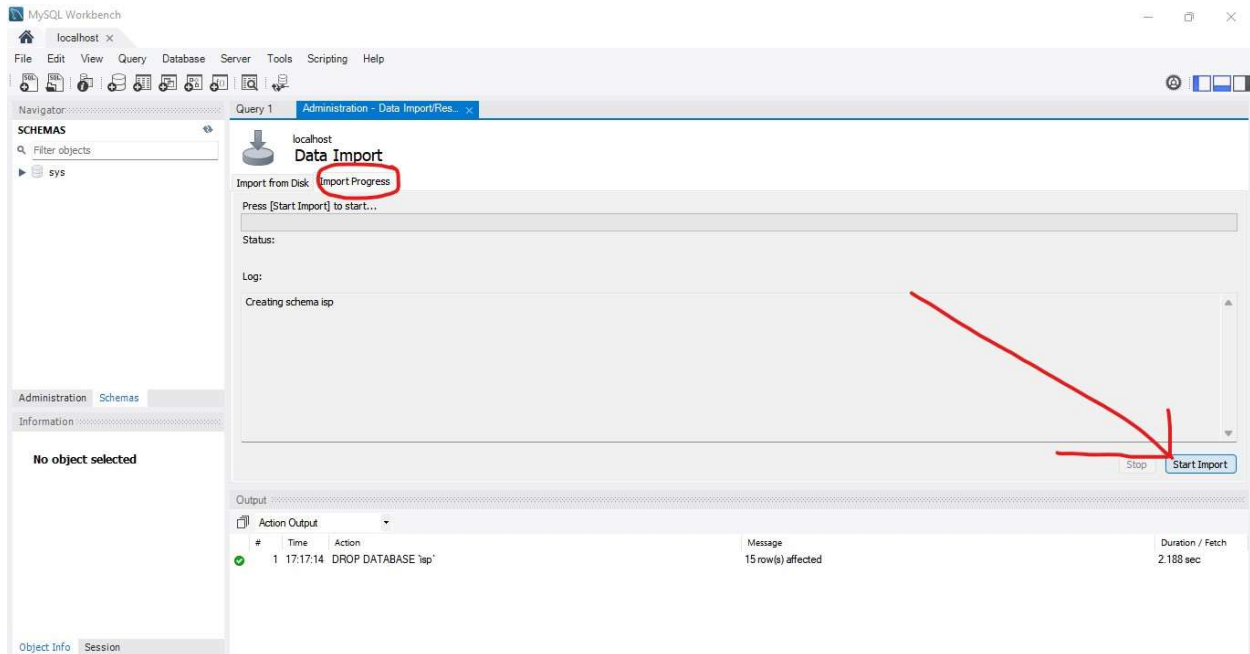

Then locate the database file in the "DATABASE EXPORT FOLDER", select it and click "OPEN"

Now for the final step for this part is to go to the next tab, "IMPORT PROGRESS" and click the "START IMPORT" button.

If all goes well the import should succeed. It will be imported as "isp."

2. PYTHON SETUP

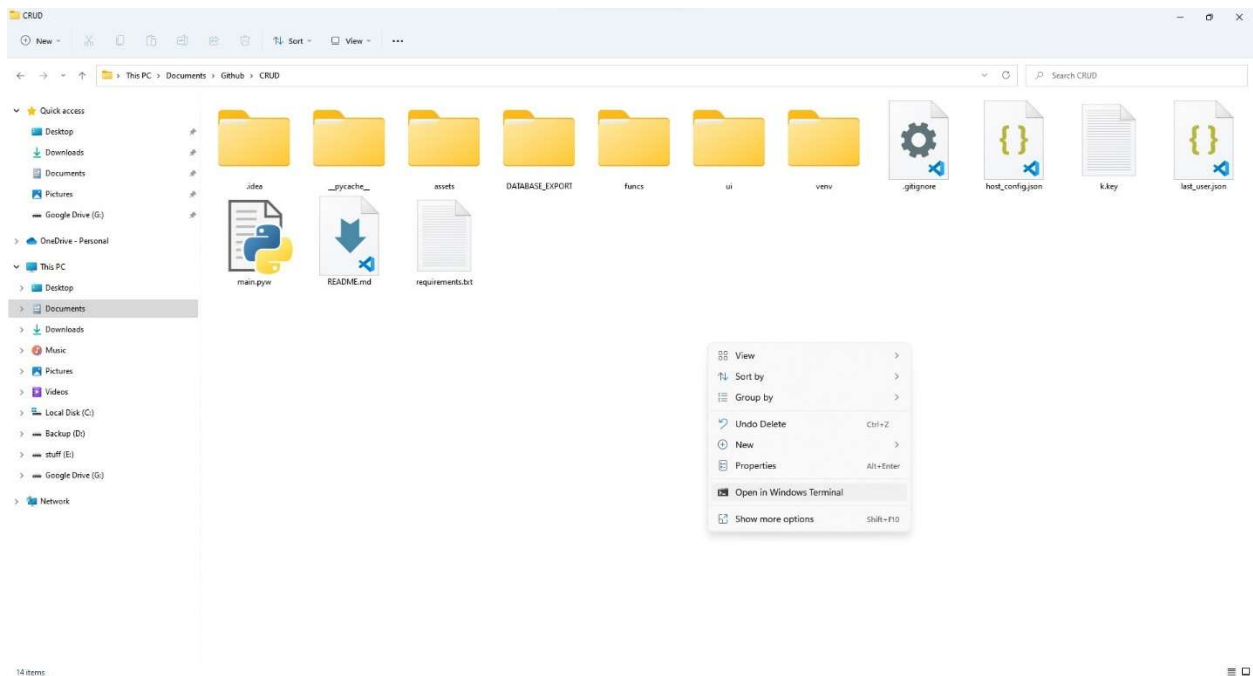

- Python packages

There are a couple specific python packages that are required to run the program properly.

These are included in the requirements.txt

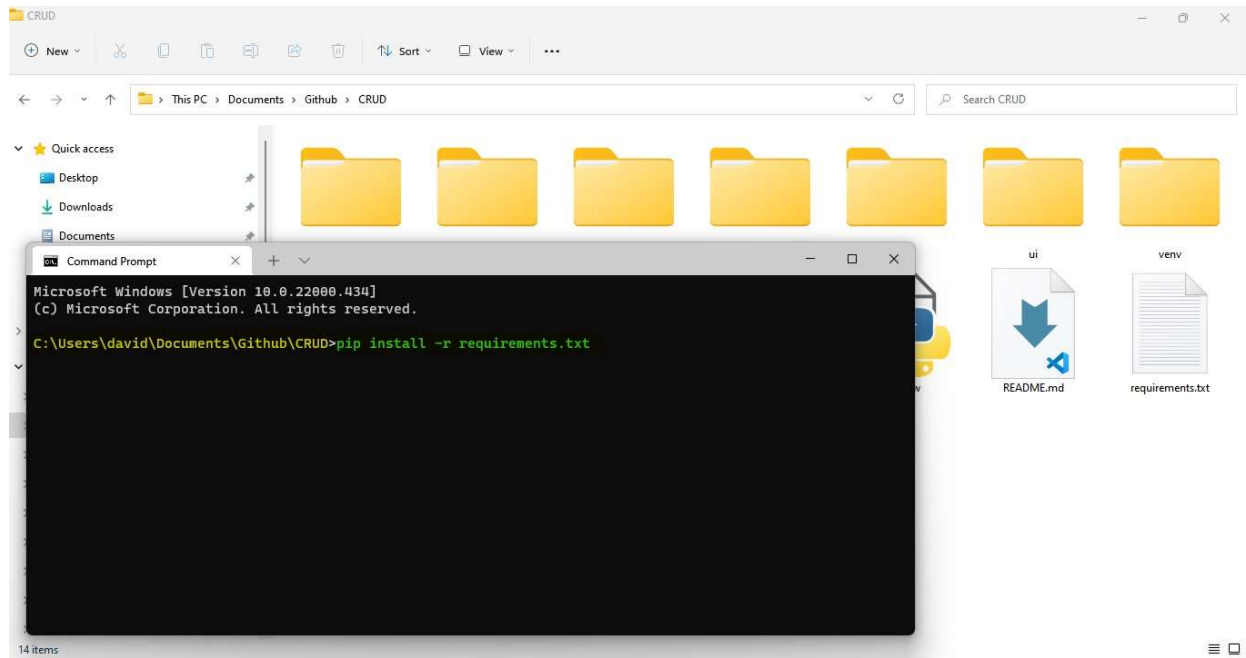

To install these just open a command prompt/terminal window in the main project's directory.

Right-clicking in the folder (Windows 11) or shift-right clicking (for other Windows versions? I'm not sure) allows you to open a prompt in that folder.

After you have opened a prompt in that folder, enter "pip install -r requirements.txt" and hit enter.

This will install all the required packages.

3. PROGRAM SETUP

- Connecting to the database

If you have successfully followed all the steps so far, the last thing left for you to do is to run the program and connect to the database.

This can be done by doubling clicking the "main.pyw" file in the project directory folder.

If your python installation and packages are installed correctly you should be greeted with a login screen.

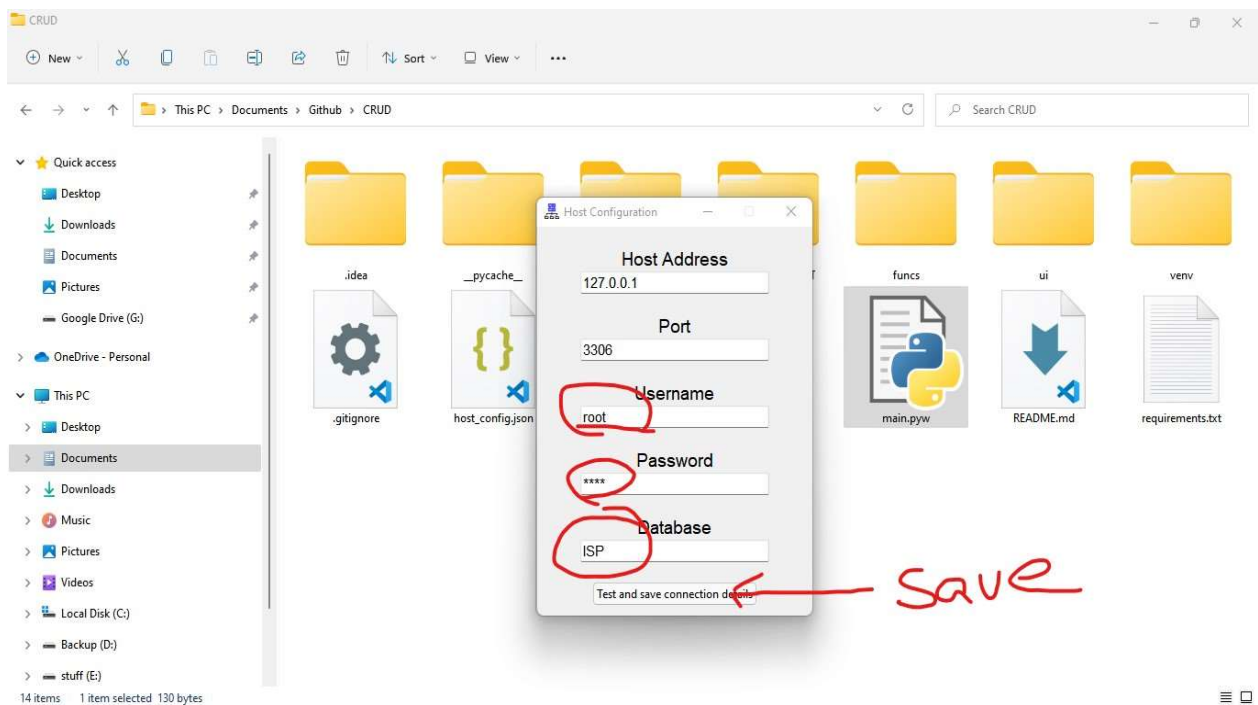

This is where you need to click the "configure host" button to set up the connection to the database server.

On the "Host Configuration" window, the only things that you would need to enter are the username, password and the database schema name.

The username and password are the same ones you used to log in to the MYSQL WORKBENCH server already.

In my case, it was root and 1234.

AND SET THE DATABASE AS ISP.

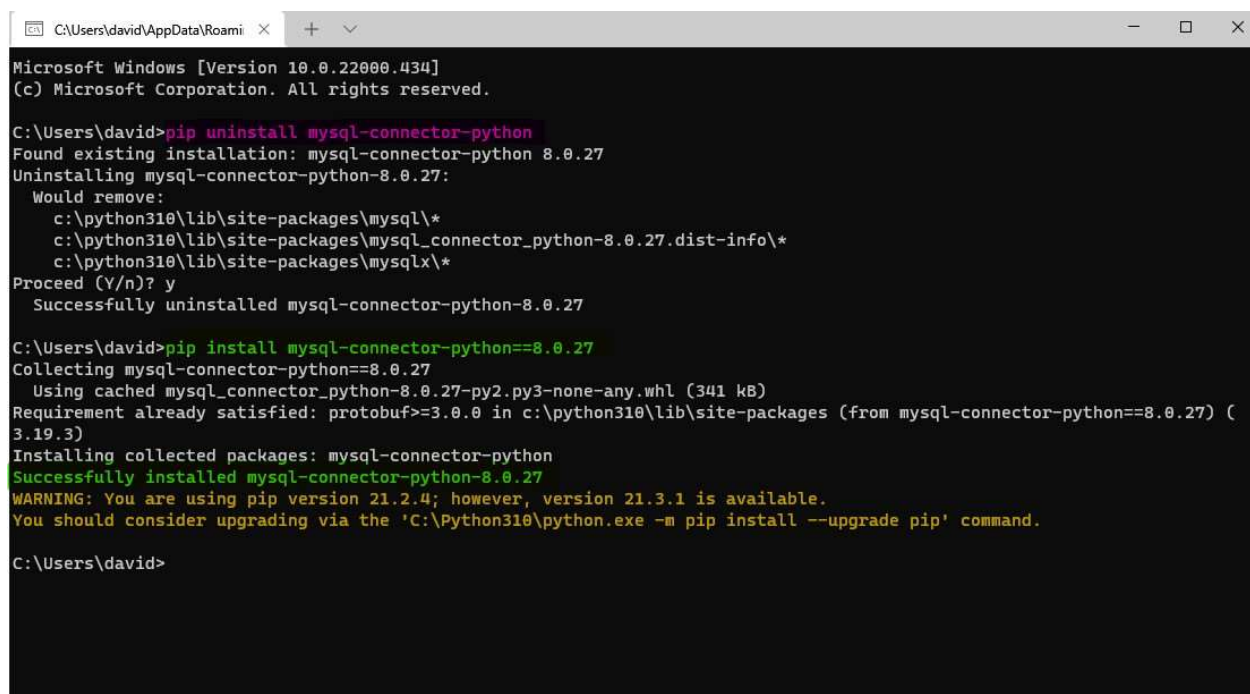

Clicking the "TEST AND SAVE" button will attempt a connection and inform you if there were any errors.

There is a chance that you are using a different version of the MySQL-connector and may encounter an error.

In this case you would need to uninstall that version and install the required one.

Do that by opening command prompt or a terminal window again and typing "pip uninstall mysql-connector-python", hitting enter, then entering "Y" to confirm the uninstall.

Then enter "pip install mysql-connector-python==8.0.27" and wait for the install to complete in order to get the version appropriate for this program to function correctly.

```
Microsoft Windows [Version 10.0.22000.434]

```

Final steps

After these steps, you should be able to login using "admin" for the username and "1234" as the password.

If all goes well you should see the main menu of the program and be able to access the various functionalities.
